1 Introduction

Stantec Consulting Ltd., as part of Ontario Line Technical Advisor (OLTA), has reviewed the massing drawings for the proposed Gerrard-Carlaw South transit-oriented community (TOC). The drawings and associated impacts have been considered with respect to the following:

- Compliance with provincial regulations from a land use planning perspective
- Recommendations made in the publicly released environmental impact assessment report (EIAR) for the Ontario Line (OL)

The purpose of this report is:

- A) to determine if noise and vibration impacts of the Ontario Line (OL) on the proposed future TOC comply with the provincial limits from a land use planning perspective and to recommend receptor-based mitigation measures and/or upgrades needed in the design at the planning approval stage; and
- B) to review potential OL noise and vibration impacts due to the addition of this TOC (a new point of reception) and to review whether this assessment would meet the same project requirements included in the noise and vibration impact assessment report appended to the EIAR (OLTA, Noise and Vibration Impact Assessment Report, April 2022).

Each of these perspectives on the potential impacts with regards to the TOC are discussed separately in Sections 3 and 4 of this report.

2 Documents Considered in Assessment

The following documents and drawings were provided and reviewed for the purposes of this assessment:

- Gerrard-Carlaw TOC Massing Drawings prepared by SvN and dated October 4, 2022 (Attachment A), specifically, the files named as:
10206938-TD012D1a-LKSRE-GERRARD-2022.10.04-PROGRESS SET and
10206938-TD012D1b-LKSRE-GERRARD-2022.10.04-PROGRESS SET
- The final Ontario Line Environmental Impact Assessment Report (EIAR)¹, April 2022
- The final OLTA Noise and Vibration Impact Assessment Report (NVIAR)², April 2022, appended to the EIAR

¹ Publicly available at [Full Report - Environmental Impact Assessment Report | Metrolinx Engage](#)

² Publicly available at [Noise and Vibration Impact Assessment Report \(metrolinxengage.com\)](#)

- The Ministry of Environment, Conservation and Parks (MECP) NPC-300 noise guideline: Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning Publication NPC-300, August 2013
- International Organization for Standardization (ISO), ISO 9613-2. Attenuation of sound during propagation outdoors – Part 2: General method of calculation. Geneva, Switzerland, 2017
- Federal Transit Administration (US FTA), U.S. Department of Transportation, Transit Noise and Vibration Impact Assessment Manual, September 2018

This review is based on the drawings provided at the time of preparing this report and considers the analysis included for the final noise and vibration impact assessment report for OL as of April 2022 (OLTA, NVIAR). The discussion within this report is limited to the information available at the time of preparing this report.

3 Impact of Ontario Line Project on the Gerrard-Carlaw South TOC

The Gerrard-Carlaw South TOC is a proposed new land development that will be adjacent to the proposed OL Infrastructure. It comprises Dickens block, Carlaw block, Thackeray block, and Badgerow block. Of these blocks, Dickens, Carlaw and Thackeray are predominantly residential and are assessed in this report. Badgerow block is commercial and is not assessed.

This section of the report will discuss the potential noise and vibration impacts that the OL project may have on the proposed TOC development and the TOC's compliance with the applicable provincial limits from a land use planning perspective.

OL tracks and other Joint Corridor tracks, which include tracks for both GO and VIA trains, are at the grade level and are exposed to the proposed TOC at this location. No stationary noise sources at Gerrard Station are identified that could potentially impact the Gerrard-Carlaw South TOC at this time. Therefore, this review is focused only airborne-noise from train passbys and train idling at the station, and vibration impact from train passbys.

3.1 Noise Criteria for TOC

The Ministry of Environment, Conservation and Parks (MECP) NPC-300 noise guideline (Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning Publication NPC-300, August 2013) is considered as the appropriate guideline for this discussion.

As per NPC-300, the Gerrard-Carlaw South TOC is required to meet the indoor sound level limits for transportation noise and the daytime outdoor sound level limit for designated Outdoor Living Areas (OLAs). These limits are shown in Table 3-1.

Table 3-1. Sound Level Limits for Transportation Noise (Rail)¹

Type of Space	Leq,16hr (dBA) 07:00 – 23:00	Leq,8hr (dBA) 23:00 – 07:00	Notes
Living/dining ²	40	40	Indoor noise limit
Sleeping quarters ²	40	35	Indoor noise limit
Outdoor living area ³	55	n/a	Outdoor noise limit Applies to common outdoor living areas associated with high-rise multi-unit buildings. Does not apply to balconies and elevated terraces less than 4m deep that are not enclosed.
Living/dining/sleeping ⁴	60	55	Outdoor “design limit” above which building components to achieve indoor limit must be specified

Table notes:

1. Road traffic limits are excluded as this assessment is focused on rail noise impact only
2. NPC-300 Table C-2
3. NPC-300 Table C-1
4. NPC-300 Section 7.2.3

Section 7.2.3 of the MECP NPC-300 recommends that rail noise control measures be included if the nighttime sound level outside the bedroom or living/dining room windows exceeds 55 dBA or the daytime sound level outside the bedroom or living/dining area windows exceeds 60 dBA. Building components including windows, walls and doors, where applicable, need to be designed so that the indoor sound levels comply with the sound level limits (Table 3-1). Therefore, acoustical performance of the building components (windows, doors and walls) will be evaluated when predicted outdoor sound levels exceed the limit. The 60/55 dBA day/night “design limit” from NPC-300 has been adopted for the Gerrard-Carlaw South TOC noise impact assessment at Plane of Window (POW) receptor locations.

Although the limit for OLAs is 55 dBA, predicted noise levels between 55 dBA and 60 dBA may be acceptable if the future occupants are made aware of the potential noise problems through appropriate warning clauses (Type A).

In addition, MECP NPC-300 specifies that the exterior walls of the first row of dwellings next to railway tracks are to be built to a minimum of brick veneer or masonry equivalent construction, from the foundation to the rafters when the rail traffic L_{eq} (24-hour), estimated at a location of a nighttime receptor, is greater than 60 dBA, and when the first row of dwellings is within 100 metres (m) of the tracks.

3.2 Analysis of TOC Noise Levels

The main transportation noise sources impacting the proposed Gerrard-Carlaw South TOC are rail noise from the existing GO/VIA rail corridor and the future OL alignment, and road noise from Gerrard St East and Carlaw Ave. The current assessment includes rail noise impact from the OL trains (i.e., train passbys and idling trains at Gerrard Station) and from the existing GO/VIA rail traffic to determine the overall noise levels at the TOC façades. This report does not consider road noise since the focus of this assessment is to evaluate the potential impact between the OL Project and the TOC. However, Gerrard Street East and Carlaw Avenue road traffic noise should be included in the future land use planning assessments for the Gerrard-Carlaw South TOC.

Noise impacts from these rail sources were predicted using the CADNA/A noise model, which implements the ISO 9613-2 standard and US FTA algorithm for rail noise. The modelling uses the following assumptions:

- Simplified massing of TOC building with smooth façades (sound reflective).
- Simplified massing of the Gerrard Station building.
- A composite ground absorption factor in the range of 0.2-0.7 is considered for the Project ($G = 0.20$ representing hard paving and $G = 0.7$ for the corridor, parks and other adjacent areas).
- Grading included for the elevated rail corridor and areas immediately adjacent to the rail corridor, with TOC grading simplified to match the "low point" elevation shown in elevation drawings.
- Crash walls (CWs) modelled as currently designed, with south CW (Dickens block) modelled to 6.15 m above local rail height and north CW (Badgerow block) modelled to 4.85 m above local rail height.
- Optimized noise barriers as designed by Hatch (Hatch, November 2021; April 2022) are included in the model.
- Train volumes for the Ontario Line as indicated in EIAR are included in the noise model.
- Train volumes for the Joint Corridor (GO/VIA and Freight) as indicated in EIAR Appendix Q (AECOM Noise and Vibration Operations Report: Ontario Line - Lakeshore East Joint Corridor, AECOM, 2021).

Train volumes considered in this review are summarized in Appendix B.

The worst-impacted facades and locations were chosen for receptors in the noise model. Plane of Window (POW) receptors were then modelled for Levels 4 and 8 on Dickens block and Carlaw block, and on Level 8 for Thackeray block for the representative windows. For each block, one OLA receptor was modelled for the outdoor amenity area (Level 7 for Carlaw and Dickens, and Level 12 for Thackeray), at a height of 1.5 m above the floor level.

A total of fourteen (14) representative POW receptors on building facades and three (3) OLA receptor were chosen for this assessment. Receptor locations are indicated in Appendix A on the October 4, 2022 drawing set. Table 3-2 and Table 3-3 provide results for the modelled receptors.

Table 3-2. Dickens Block: Rail Noise Assessment Results

Receptor ID	Assessed Receptor Location Description (Drawing ID, Location, Level, Section Lines ¹)	Noise Criteria (dBA)		Noise Impact with Joint Corridor			
				Predicted Outdoor Noise Levels (dBA)		Exceedance (dB)

2. Receptor is an Outdoor Living Area (OLA).

3.3 Discussion of Noise Results and Mitigations Related to TOC

The predicted noise levels from the rail noise sources show that sound levels at POW and OLA receptors are expected to exceed the "design noise limits" provided in Table 3-1 (day/night limits of 60/55 dBA for POW and daytime noise limit of 55 dBA for OLAs).

Combined rail noise (OL and other trains) at the POW receptors exceeded by:

- 10-11 dB on the façades facing the rail corridor, and 4-5 dB on other facades with some shielding from the TOC building(s) for Dickens block;
- 8-9 dB on façades facing the rail corridor for Carlaw block; and
- 1 dB on facades facing the rail corridor for Thackeray block that got some shielding from other TOC building(s).

Combined rail noise (OL and other trains) at the OLA receptors exceeded by:

- 6-8 dB during daytime for all TOC buildings.

As per the guideline (MECP NPC-300), the acoustical performances of building components (windows, doors and walls) are to be designed to achieve the indoor noise limit of 40/35 dBA (day/night). This design consideration is required for all facades facing the rail corridor with direct line of sight (no shielding). For the facades facing the rail corridor that are shielded or partially shielded by other TOC buildings require experience lower sound levels.

Based on the predicted outdoor sound levels on the TOC facades, preliminary window glazing requirements were estimated to meet the indoor limits. As per the NPC-300 guideline, it is also required that the exterior walls of the TOC to be built to a minimum of brick veneer or masonry equivalent construction. Therefore, a brick veneer wall was considered for exterior to estimate the minimum Sound Transmission Class (STC) rating requirements for the windows and doors.

Based on the outdoor noise modelling results and the brick veneer or masonry equivalent construction required for the exterior wall, the STC rating for glazing will be higher than building code standard ratings. For example, at the worst-case locations that exceed the design limit by 10-11 dB, the following ratings for windows may be required to achieve the 40/35 dBA (day/night) indoor limit:

- For 50% wall and 50% window construction (assuming inoperable windows), STC-39.
- For 100% glazing (assuming inoperable windows), STC-41.

An example of a window construction to achieve STC-39 is a sealed window frame with $\frac{1}{4}$ " laminated interior glass, $\frac{1}{2}$ " air gap and $\frac{1}{4}$ " standard exterior glass, or similar. A better configuration with thicker glass and/or air gap is required for STC-41. Additionally, 2 m parapet walls are required for the common amenity areas on all assessed blocks to mitigate sound levels during daytime use (see Attachment A annotated drawing sets). The 2 m parapet walls are recommended to bring sound levels down to 58 dBA for Dickens block, 57 dBA for Carlaw block,

and 56 dBA for Thackeray block. These noise levels are acceptable for these OLAs with an appropriate noise warning clause.

The following noise warning clauses may be required, depending on the sound level after noise mitigation, to include in the agreements of Offers of Purchase and Sale, lease/rental agreements and condominium declarations:

- TYPE A: "Purchasers/tenants are advised that sound levels due to increasing road, rail and/or air traffic may occasionally interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the MECP."
- TYPE B: "Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road, rail and/or air traffic may on occasions interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the MECP."
- TYPE C: "This dwelling unit has been designed with the provision for adding central air conditioning at the occupant's discretion. Installation of central air conditioning by the occupant in low and medium density developments will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the MECP."
- TYPE D: "This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the MECP."

3.4 Vibration Criteria for TOC

The Gerrard-Carlaw South TOC is a new land development that would be adjacent to the OL Project. To assess vibration impacts from the rail transportation sources to the Gerrard-Carlaw South TOC, the guidelines described in the US FTA Manual (2018) are considered for rail vibration impact assessment:

Table 3-4. Applied Criteria for Operational Vibration Assessment

Type of Receptor	Ground-borne Vibration (GBV) - Limit ¹	Ground-borne Noise (GBN) - Limit ¹
Residence	0.1 mm/s (72 VdB)	35 dBA
Institutional/Commercial (Office)	0.14 mm/s (75 VdB)	40 dBA

Table note:

¹ VdB is reference to 1 micro-in/s; velocity is in RMS; dBA is reference to 20 micro-Pa.

3.5 Vibration Impact of OL on TOC Buildings

The assessment was conducted in accordance with the US FTA Manual (2018) with the adjustment factors and assumptions as summarized in Table 3-5. For the assessment of operational vibration, the analysis methodology described in the US FTA Manual has been used along with assumptions and mitigation recommendations included in the NVIAR (OLTA, April 2022) for the train operations. This assessment assumes inefficient soil propagation due to separation of the TOC buildings from the track support with retaining wall.

Table 3-5. Rail Vibration Model Inputs and Assumptions

	Source/Path Factor	Parameters and Assumptions
Train Definition	Train Type	LRT
	Train Speed ¹	80 km/h
	Stiff Suspension	No
	Resilient Wheels	No
	Worn Wheels	No
Rail Definition	Rail Type	Continuous Welded Rail
	Worn or Corrugated Track	No
	Special Trackwork	No
Path Definition	Efficient Propagation in Soil	No
	Propagation in Rock Layer	No
	Coupling Loss	Yes
GBN Conversion	Dominant Frequency	Low (< 30 Hz)

Table note:

1. The maximum OL train speed is considered assuming before and after revenue service operation. This is considered the worst-case (conservative) operation scenario based on the pre- and post-hour service deployment in which the train may not stop at the station.

Rail operational activities are not expected to generate vibration levels exceeding the Ground-Borne Vibration (GBV) and Ground-Borne Noise (GBN) limits at the residential and office spaces of the Gerrard-Carlaw South TOC without any vibration mitigation measures as described in the NVIAR (OLTA, April 2022) on the track.

Assessment of potential GBV and GBN at residential floors (Level 1 and Level 3) and office floor (Level 1) for Gerrard-Carlaw South TOC is based on the information provided (see Section 2). Predicted GBV and GBN at the nearest TOC receptors are summarized in Table 3-6. The analysis predicts that indoor GBV and GBN meet the criteria in Table 3-4.

Table 3-6. Rail Vibration Assessment Results (Dickens Block)

Assessment Position	GBV Criteria (mm/sec)	GBN Criteria (dBA, ref. 20 µ-Pa)	Predicted Indoor GBV (mm/sec)	Predicted Indoor GBN (dBA, ref. 20 µ-Pa)
Level 1 – Residence	0.1	35	0.050	16
Level 3 – Residence	0.1	35	0.028	11
Level 1 – Office	0.14	40	0.040	14

3.6 Noise and Vibration Mitigation for Gerrard-Carlaw South TOC

OLTA has completed a review of the potential noise and vibration impacts from the OL project on the Gerrard-Carlaw South TOC, and our findings are summarized below.

1. The Gerrard-Carlaw South TOC is expected to experience higher sound level than the MECP limit of 60/55 dBA (daytime/nighttime) at the bedroom or living/dining room façade/windows (outside) from rail impacts alone. As a result, building components (windows and wall) were evaluated to demonstrate how the indoor noise limit of 40/35 dBA (daytime/nighttime) can be achieved:
 - Due to proximity to the Joint Corridor and high sound levels on the building façade, the exterior walls of the TOC should be constructed of brick veneer, masonry, or equivalent construction as per the guidelines.
 - Based on the outdoor façade noise levels and the expected exterior wall construction (brick veneer or masonry equivalent construction), STC as high as STC-39 to STC-41 may be required for inoperable windows along façades facing the rail corridor, depending on the percentage of wall area that is glazed. The façades that experience lower noise levels (e.g., facades with some shielding from adjacent TOC buildings) require lower STCs than these.
2. The sound levels at the outdoor amenities are expected to exceed the MECP limit of 55 dBA for OLAs during daytime. The exceedance is due to the combined Joint Corridor rail traffic rather than OL traffic alone. Parapet walls of 2 m high are required for the common amenity areas to mitigate sound levels to below 60 dBA, which is allowed with a warning clause.
3. Noise warning clauses may be required for the units that experience high sound levels and they should be included in the agreements of Offers of Purchase and Sale, lease/rental agreements.
4. This assessment does not consider road traffic noise, rather it focussed on rail noise and assumes that road noise is less significant than noise impacts from rail. However, OLTA acknowledges that the NPC-300 guideline does combine both rail and road noise in the assessment. Combined rail noise and road noise should be considered when a detailed acoustic assessment of the site is conducted in the future, as part of the detailed design of the Project.

5. Predicted GBV and GBN levels are expected to meet the criteria at the Gerrard-Carlaw South TOC. No additional mitigation is required.

This assessment of TOC land use planning rail noise impacts is provided as a preliminary consideration of impacts and expected design and mitigation requirements. OLTA expects that the TOC shall retain their own acoustic consultant to complete a noise and vibration impact study for the TOC as part of permit application, and should consider all impacts (including road) on the TOC.

4 Impact of Gerrard-Carlaw South TOC as an Additional Receptor on EIAR Requirements

The Gerrard-Carlaw South TOC has the potential, as an additional receptor, to impact the requirements as outlined in the Noise and Vibration Impact Assessment Report (OLTA, April 2022). However, this assessment does not seek to modify these requirements. Instead, it reviews whether this assessment would meet the same requirements appended to the EIAR (OLTA, Noise and Vibration Impact Assessment Report, April 2022).

The proposed Gerrard-Carlaw South TOC is at a similar setback distance from the OL Project for the other nearby receptors (i.e., existing residential receptors) assessed in the EIAR NVIAR (OLTA, April 2022). The Gerrard-Carlaw South TOC does not introduce a new receptor type with more stringent noise limits than existing dwellings. Therefore, the proposed TOC or its location is not expected to impact the requirements outlined in the NVIAR. The OL is expected to comply with its operational noise and vibration criteria with the introduction of the proposed Gerrard-Carlaw South TOC.

Construction of the Gerrard-Carlaw South TOC is expected to occur after the completion of Gerrard Station and the Ontario Line. Therefore, the potential noise and vibration impacts during construction of OL elements is not a concern and not reviewed in this report.

5 Closing

Stantec, as part of OLTA, has reviewed the massing drawings for the Gerrard-Carlaw South TOC. The drawings and associated impacts have been considered with respect to compliance with provincial regulations from a land use planning perspective as well as with respect to the recommendations made in the publicly released EIAR for the OL Project.
