Tyrone Gan, P. Eng. Principal-In-Charge

## Disclaimer

The material in this report reflects HDR's professional judgment considering the scope, schedule and other limitations stated in the document and in the contract between HDR and the client. The opinions in the document are based on conditions and information existing at the time the document was published and do not consider any subsequent changes. In preparing the document, HDR did not verify information supplied to it by others. Any use which a third party makes of this document is the responsibility of such third party. Such third party agrees that HDR shall not be responsible for costs or damages of any kind, if any, suffered by it or any other third party resulting from decisions made or actions taken based on this document.

In preparing this report, HDR relied, in whole or in part, on data and information provided by the Client and third parties that was current at the time of such usage, which information has not been independently verified by HDR and which HDR has assumed to be accurate, complete, reliable, and current. Therefore, while HDR has utilized its best efforts in preparing this report, HDR does not warrant or guarantee the conclusions set forth in this report which are dependent or based upon data, information or statements supplied by third parties or the client, or that the data and information have not changed since being provided in the report. Any use which a third party makes of this document is the responsibility of such third party. Such third party agrees that HDR shall not be responsible for costs or damages of any kind, if any, suffered by it or any other third party resulting from decisions made or actions taken based on this document.

# Project Team

Project Manager	Carl Wong, P.Eng.
Project Engineer	Arth Vin, P.Eng.
Technical Support	Jacky Chan, EIT

This report was initially prepared using the previous version of the Site Plan (August 23rd, 2022), including the Site statistics. The revised Site Plan as part of this package has the same number of dwelling units and 7 sq. ft fewer retail space than the previous site plans (August 23rd, 2022). The report, including the analysis and recommendations, has not been updated because the changes to the Eastern Rezoning Resubmission Package since this report are minimal and will not materially affect the outcomes and recommendations provided in this report.

# 1 Introduction

HDR Corporation was retained by Metrolinx to undertake a Transportation Impact Study and Parking Assessment for a proposed mixed-use development to be located on 356 Eastern Avenue, north of the future East Harbour Transit Hub (EHTH).

The subject properties currently contain a self-storage facility. The proposed redevelopment consists of a 12-storey high-rise with non-residential uses on the first floor:

- **Residential**
  - Consists of 142 residential units (100 one-bedroom, 21 two-bedroom, 17 three-bedroom, and 4 townhouse units).
- **Non-residential**
  - 607 m<sup>2</sup> and 309 m<sup>2</sup> of space is provided on the ground level, and mezzanine, respectively for non-residential use.

Underground parking will be provided on site. A ramp to the underground parking is accessible only via the site driveway on Saulter Street. The site driveway on Lewis Street is intended as access for trucks loading and unloading. **Figure 1** shows the location of the redevelopment on 356 Eastern Avenue.

The traffic impact study report includes documentation of the following components:

- Existing Conditions
- Background Traffic Conditions
- Proposed TOC Trip Generation
- Future Total Traffic Conditions with the TOC
- Parking Assessment
- Loading Assessment
- Transportation Demand Management
- Preliminary Findings and Next Steps

Figure 1: Study Area and Site Context

## 1.1 Scope of Work

The scope of work has been prepared in accordance with the **City of Toronto Guidelines for the Preparation of Transportation Impact Studies** (2003), and is as follows:

<b>Study Area</b>	<ul style="list-style-type: none"> <li>The study area is bounded by Broadview Avenue, Eastern Avenue, Queen Street, and McGee Street</li> </ul>
<b>Analysis Scenarios</b>	<ul style="list-style-type: none"> <li>Existing 2022 Traffic Conditions</li> <li>Future 2032 Background Traffic Conditions (10-year horizon) <i>Includes 0.5% annual general background traffic growth, the future East Harbour Station plus other new development traffic in the vicinity of the site</i></li> <li>Future 2032 Total Traffic Conditions (10-year horizon) <i>Includes future background traffic volumes plus traffic resulting from the proposed development, minus traffic from the existing site land uses.</i></li> </ul>
<b>Analysis Time Periods</b>	<p>The following time periods were analyzed as they represent peak trip generation times for residential developments:</p> <ul style="list-style-type: none"> <li>Weekday AM peak hour between 7:00 AM and 9:00 AM</li> <li>Weekday PM peak hour between 3:00 PM and 6:00 PM</li> </ul>
<b>Study Area Intersections for Analysis</b>	<p>The following intersections were analyzed for capacity, level of service, and delays:</p> <ul style="list-style-type: none"> <li>Queen Street and Broadview Avenue</li> <li>Queen Street and Lewis Street</li> <li>Queen Street and Saulter Street</li> <li>Queen Street and McGee Street</li> </ul>
<b>Parking and Loading Study</b>	<p>A loading assessment was undertaken for the proposed development using the City of Toronto Zoning By-law 569-2013 as the basis of the assessment. Parking assessment was undertaken using Zoning By-law 89-2022. A Transportation Demand Management (TDM) Plan has been developed to further support the proposed parking supply and to ensure a wholesome approach to transportation management that addresses the needs of all modes and achieves planning goals of encouraging multi-modal decision making through the provision of alternative and sustainable modes of travel, and reduce single-occupant vehicle use.</p>

## 1.2 Intersection Operations and Analysis Methodology

Intersection operations were assessed for the study area intersections and future site driveways using the software program Synchro Traffic Software Version 11, which employs methodology from the **Highway Capacity Manual** (HCM 2000, 2010, and 6<sup>th</sup> Edition) published by the Transportation Research Board National Research Council. Synchro can analyze both signalized and unsignalized intersections in a road corridor or network, taking into account the spacing, interaction, queues and operations between intersections.

The signalized and unsignalized intersection analysis considers three separate measures of performance:

- The capacity of all intersection movements, represented by the volume to capacity (v/c) ratio;
- the level of service (LOS) for all intersection turning movements as well as for the overall intersection. The overall intersection LOS is based on the average control delay per vehicle (weighted) for the various movements through the intersection; and
- the forecasted queue lengths (95<sup>th</sup> percentile queue length) and storage requirements.

LOS is an indicator of how long a vehicle must wait to complete a movement and is represented by a letter between ‘A’ and ‘F’, with ‘F’ being the longest delay. The volume to capacity (v/c) ratio is a measure of the degree of capacity utilized at an intersection. HCM definitions are summarized in **Table 1**.

**Table 1: Highway Capacity Manual Level of Service Definitions**

Level of Service (LOS)	Signalized Control Delay per Vehicle (s)	Unsignalized Control Delay per Vehicle (s)	Description
<b>A</b>	≤ 10	≤ 10	Ideal
<b>B</b>	> 10 and ≤ 20	> 10 and ≤ 15	Acceptable
<b>C</b>	> 20 and ≤ 35	> 15 and ≤ 25	Acceptable
<b>D</b>	> 35 and ≤ 55	> 25 and ≤ 35	Somewhat undesirable
<b>E</b>	> 55 and ≤ 80	> 35 and ≤ 50	Undesirable
<b>F</b>	> 80	> 50	Unacceptable

The analysis undertaken in this study also follows the **City of Toronto Guidelines for Using Synchro 11 (Including SimTraffic 11<sup>1</sup>)** (March 18th, 2016), City of Toronto **‘Guidelines for the Preparation of Transportation Impact Studies<sup>2</sup>’** (July 2003), and City of Toronto **‘Traffic Signal Operations Policies and Strategies<sup>3</sup>’** (May 2015)<sup>3</sup>.

## 2 Existing Conditions

### 2.1 Site Context

As shown in **Figure 1**, the study site is bounded by Lewis Street to the West, Saulter Street and Lakeshore East GO rail line to the East, and Eastern Avenue to the South.

The site is situated in an area with decent surface transit service on Queen Street. The closest existing TTC streetcars/busses are located on Queen Street, approximately 400 metres to the north, and the future EHTH will be located south of the study site. The future EHTH will contain the new Ontario Line East Harbour Station, and a new GO rail station. The site is currently occupied by a large self-storage facility. Public vehicle access to the existing site is provided on Lewis Street. Additional access to the site is off of Saulter Street via a secured wooden gate.

### 2.2 Existing Road Network

The existing road network is shown in **Figure 2**, including existing traffic controls and lane configurations. All study roadways are under the jurisdiction of the City of Toronto.

The existing road network is described below:

<b>Queen Street</b>	Queen Street is a two-way east-west minor arterial street with a speed limit of 40 km/h. It has a four-lane cross section, with sidewalks on both sides of the street. Within the study area, portions of Queen Street narrow to one vehicular travel lane per direction to accommodate for parklets.
<b>Eastern Avenue</b>	Eastern Avenue is a two-way east-west major arterial street with a speed limit of 50 km/h. It has a four-lane cross section, with sidewalks on both sides of the street.
<b>Broadview Avenue</b>	Broadview Avenue is a two-way east-west minor arterial street with a speed limit of 40 km/h. It has a four-lane cross section, with sidewalks provided on both sides of the street.
<b>Lewis Street</b>	Lewis Street is a local north-south street with sidewalks on both sides of the street. Lewis street operates as a two-way street at Eastern Avenue, then transitions to a one-way northbound street north of the site access at 350 Eastern Avenue
<b>Saulter Street</b>	Saulter Street is a local north-south street with sidewalks on both sides of the street. Saulter Street begins at Queen Street and ends at the subject site and accommodates both northbound and southbound travel.
<b>McGee Street</b>	McGee Street is a local north-south street with sidewalks on both sides of the street. McGee street is a one-way street that only accommodates for southbound travel.

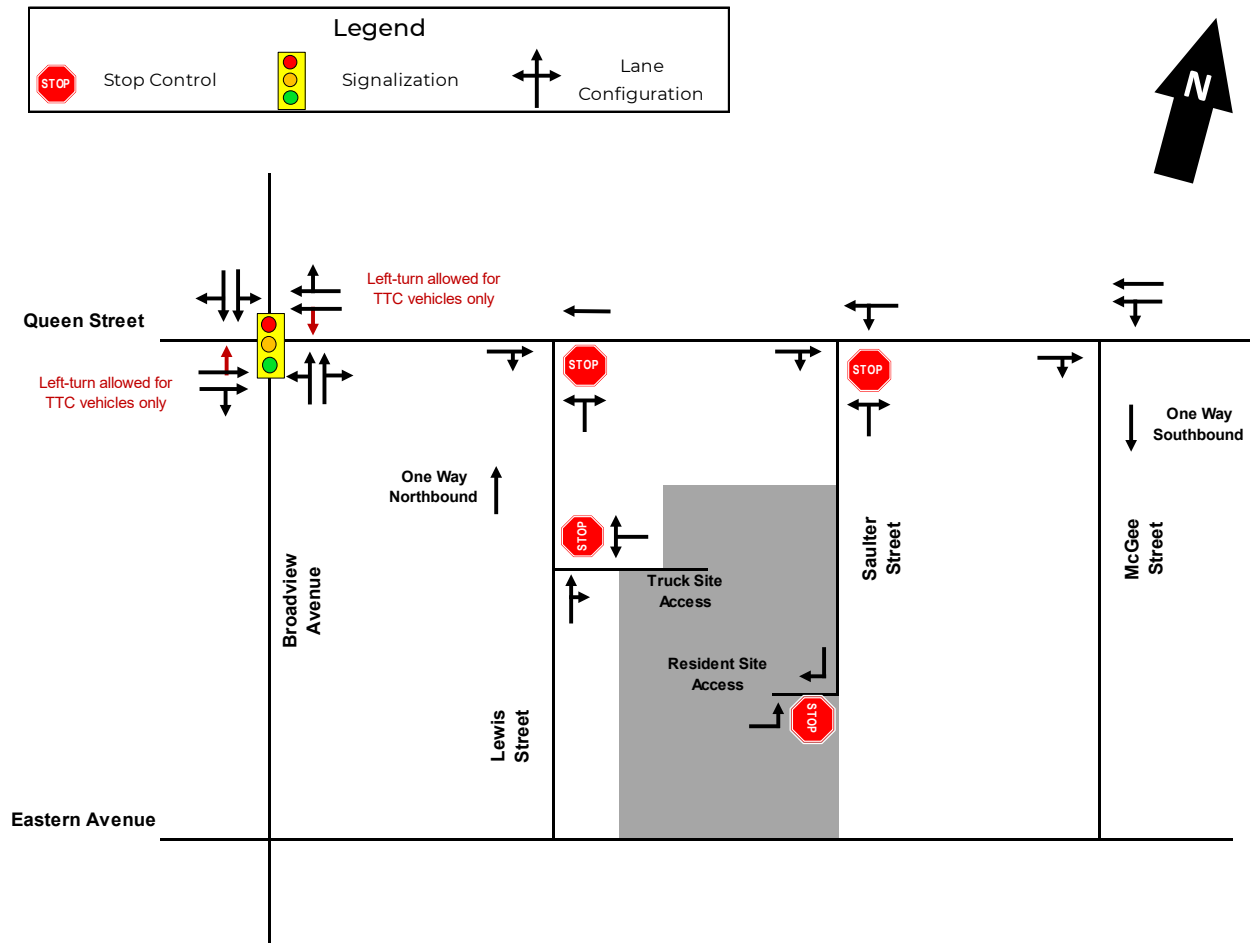

Figure 2: Existing Lane Configuration and Traffic Control

### 2.3 Existing Transit Services

The TTC operates bus services along Broadview Avenue and Queen Street in the study area. The surface transit routes provide connections to downtown and to the Toronto subway system (Line 1 at King Station and Line at Broadview Station). Existing transit services are summarized in **Table 2**, and an excerpt from the TTC system map<sup>4</sup> is also shown in **Figure 3**. Route 504 operates along the King Street Transit Priority Corridor, where stops are generally at the far side of each intersection, and through and left movements are banned for most traffic at most intersections between Bathurst Street and Jarvis Street. The TTC also provides a night bus service on Queen Street.

The Stouffville and Lakeshore East GO lines are located immediately east of the site, and the site is approximately 6.0 kilometres away from the nearest GO stations at Danforth Station. Overall, there is good transit network availability in the broader study area.

<sup>4</sup> TTC System Map for August 2022, [https://tcc-cdn.azureedge.net/-/media/Project/TTC/DevProto/Images/Home/Routes-and-Schedules/Landing-page-pdfs/TTC\\_SystemMap\\_2021-11.pdf?rev=0eee66a913bc40ae930be7f546c547d8](https://tcc-cdn.azureedge.net/-/media/Project/TTC/DevProto/Images/Home/Routes-and-Schedules/Landing-page-pdfs/TTC_SystemMap_2021-11.pdf?rev=0eee66a913bc40ae930be7f546c547d8)

**Table 2: Transit Service Summary**

<b>Route #</b>	<b>Route Name</b>	<b>Route Description</b>	<b>Peak Hour Headways</b>	<b>Nearest Stops &amp; Walking Distance</b>
<b>501</b>	Queen	East west route from Long Brach Loop to Neville Park Loop	< 9 minutes	Queen Street and Broadview Avenue (approx.. 400 metres)
<b>503</b>	Kingston	East-west route between Kingston Road and Victoria Park Avenue	< 10 minutes	Queen Street and Broadview Avenue (approx.. 400 metres)
<b>504B</b>	King	Operates between Dundas West Station and Broadview Station	< 8 minutes	Queen Street and Broadview Avenue (approx.. 400 metres)

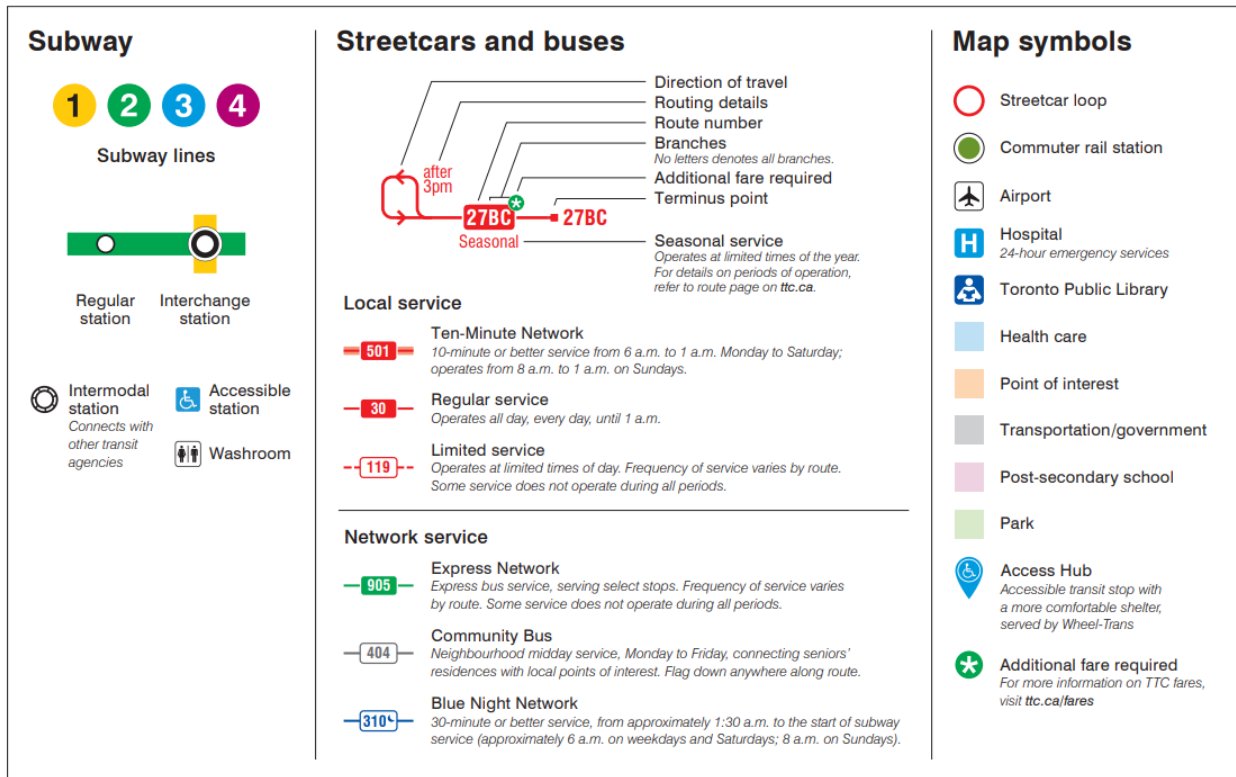

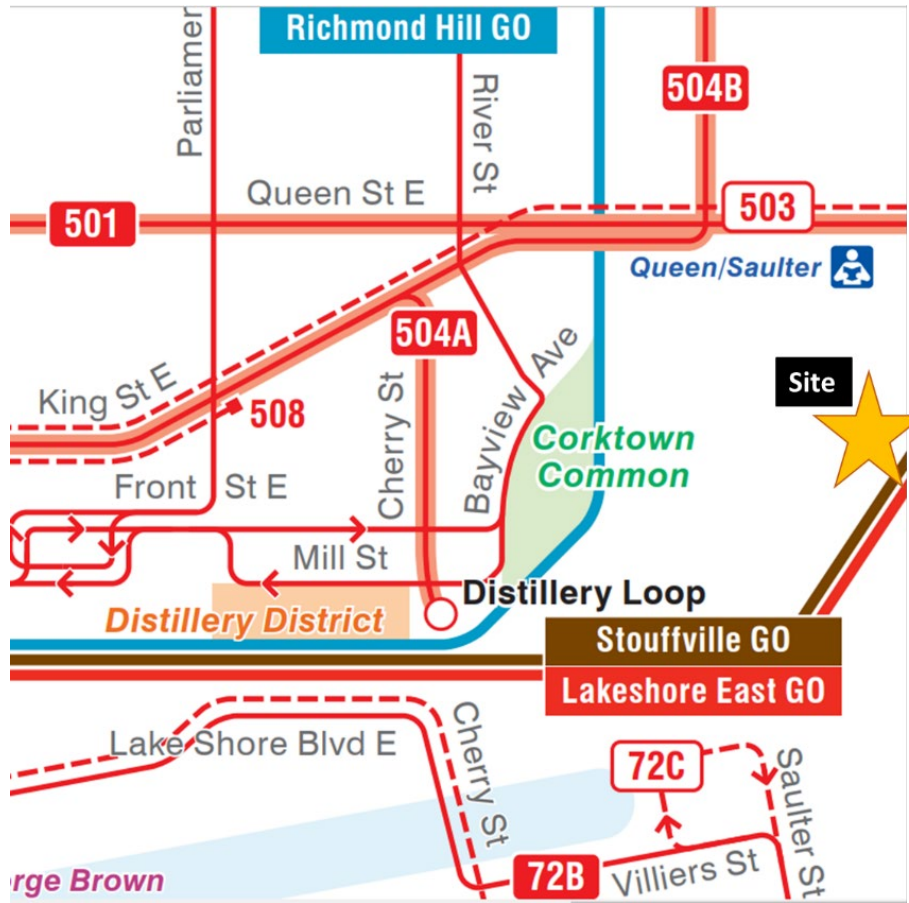

Figure 3: Existing Transit Service

## 2.4 Existing Cycling and Pedestrian Facilities

Pedestrian connectivity within the study area is good in terms of sidewalks, paths, and pedestrian crossings. All major streets have sidewalks on both sides. Crosswalks are present on all legs of the signalized intersections within the study area.

Dedicated cycling facilities are not present in the study area. The existing active transportation network is depicted in **Figure 5**. Generally, the sidewalks in the study area are 1.8m wide or wider, but due to objects such as power poles, traffic signals, waste bins and street trees, the clear pedestrian zone may be narrower in many locations, as illustrated in **Figure 4**.

The highest pedestrian activity area is generally along Queen Street likely due to the high number of bus and streetcar stops, retail, and restaurants along the street.

**Figure 4: Sidewalks on Queen Street (north side of Broadview Avenue, looking east of Queen Street)**

**Figure 5: Active Transportation Network**

## 2.5 Existing Traffic Volumes

A summary of the intersections and their sources are provided in **Table 3** below.

HDR used counts from the City of Toronto’s Open Database for the intersection of Queen Street and Broadview, and Queen Street and Saulter Street. The most recent counts for both intersections were used. Turning movement going into and out of Lewis Street was collected on site on August 16<sup>th</sup> and 19<sup>th</sup>, 2022. Through volumes at Lewis Street were balanced with the City’s database counts. Turning volumes at McGee Street were estimated with the Institute of Transportation Engineers (ITE) Trip Generation Informational Report (11<sup>th</sup> edition), as well as balanced with the City’s latest counts at McGee Street and Eastern Avenue.

**Table 3: Traffic Count Source**

Intersection	Count Source / Date
Queen Street and Broadview Avenue	City of Toronto Traffic Count Database – 2021
Queen Street and Lewis Street	City of Toronto Traffic Count Database (2021) + Site Counts (2022)
Queen Street and Saulter Street	City of Toronto Traffic Count Database - 2017

Intersection	Count Source / Date
Queen Street and McGee Street	Estimated using trip generation and volume balancing with City of Toronto Traffic Count Database (2020)

Individual intersection peak hour traffic volumes are shown and were used in the study analysis, which is more conservative than calculating a global peak hour.

**Figure 6** shows the existing traffic volumes at the study area intersections.

Legend			
xx	A.M. Peak Hour Traffic Volumes	(xx)	P.M. Peak Hour Traffic Volumes
xx	A.M. Peak Hour Pedestrian Volumes	(xx)	P.M. Peak Hour Pedestrian Volumes
xx	A.M. Peak Hour Conflicting Bike Volumes	(xx)	P.M. Peak Hour Conflicting Bike Volumes

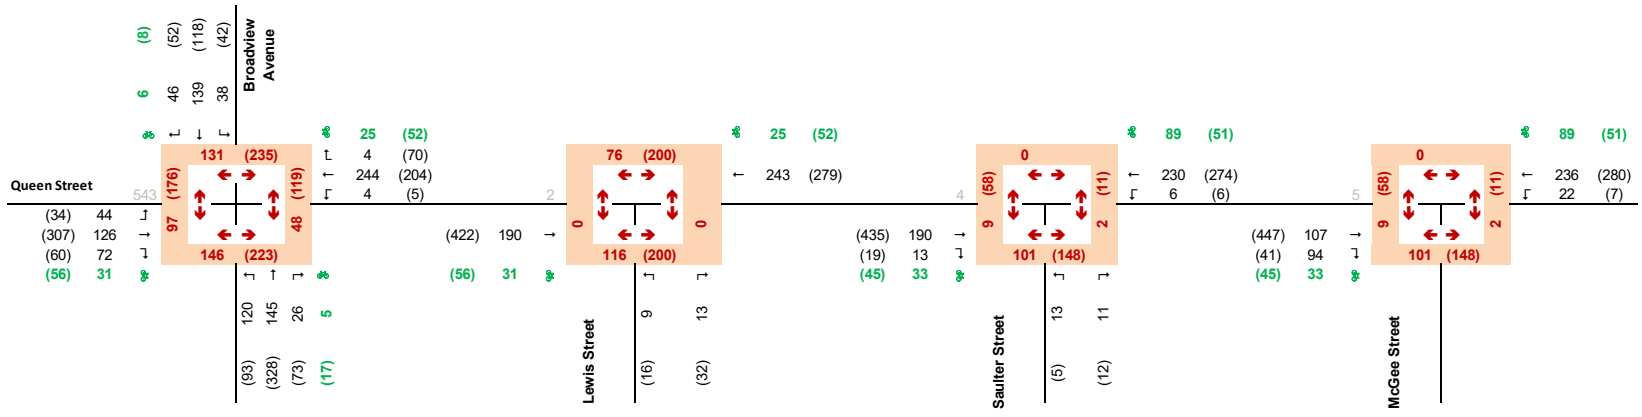

Figure 6: Existing Traffic Volumes

## 2.6 Existing Operations

Based on the existing traffic volumes and road network, intersection operations were assessed using Synchro 11 traffic analysis software. Existing signal timings used in the analysis are provided in **Appendix A**.

**Table 4** summarizes the level-of-service (LOS) and volume/capacity ratio (v/c ratio) for each movement under existing conditions. Detailed Synchro results and reports for all study area intersections are provided in **Appendix B**.

Under existing traffic conditions, Queen Street and Broadview Avenue intersection operates at LOS B during the AM peak hour and LOS D during the PM peak hour. All movements operate under capacity and do not exceed available storage.

**Table 4: Existing Conditions – Summary**

Intersection and Movement		Lanes	Storage (m)	AM Peak Hour			PM Peak Hour		
				LOS	v/c	95 <sup>th</sup> Q	LOS	v/c	95 <sup>th</sup> Q
<b>Queen &amp; Broadview</b>		-	-	<b>B</b>	-	-	<b>D</b>	-	-
Eastbound	Left-Through-Right	2	80	A	0.16	12	A	0.26	28
Westbound	Left-Through-Right	2	92	A	0.15	16	A	0.20	17
Northbound	Left-Through-Right	2	225	C	0.64	26	C	0.87	49
Southbound	Left-Through-Right	2	64	C	0.43	28	C	0.51	27
<b>Queen &amp; Lewis</b>		-	-	-	-	-	-	-	-

<b>Queen &amp; Saulter</b>		-	-	-	-	-	-	-	-
Westbound	Left	1	75	A	0.01	0	A	0.01	0
Northbound	Left-Right	1	235	B	0.05	1	C	0.05	1
<b>Queen &amp; Saulter</b>		-	-	-	-	-	-	-	-
Westbound	Left	1	71	A	0.02	0	A	0.01	0

Note: LOS = level of service; v/c = volume to capacity ratio; 95<sup>th</sup> Q = 95<sup>th</sup> Percentile Queue using HCM 2000, and Pedestrian Crosswalk LOS using HCM 2010. Critical movements are highlighted in **red** as defined by the City's TIS Guidelines. Movements with LOS F are highlighted in **yellow**.

# 3 Future Background Conditions

## 3.1 Planned Roadway Improvements

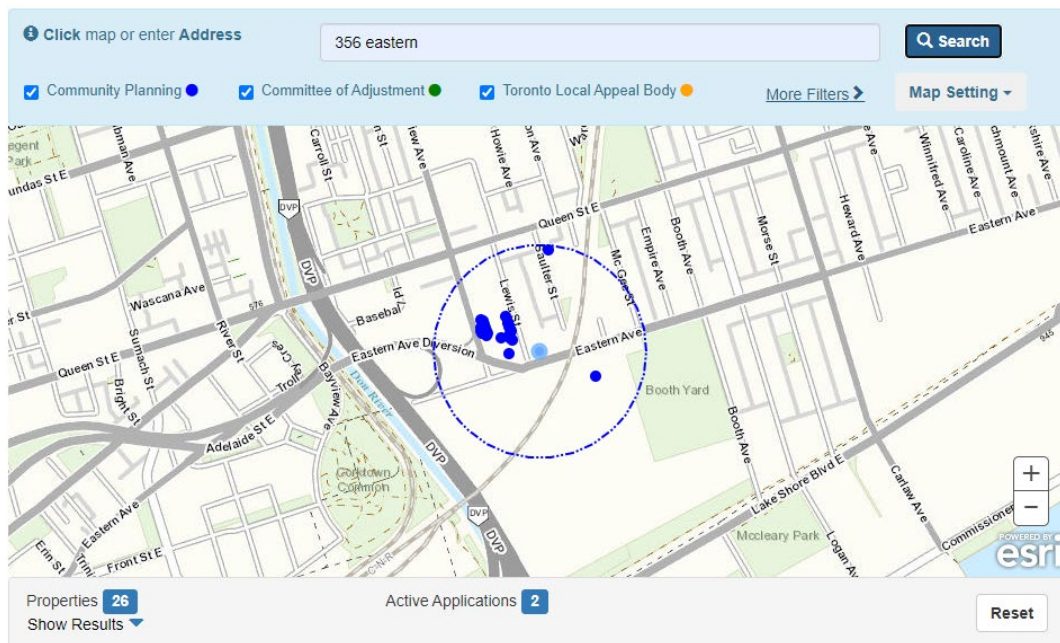

Based on the City of Toronto’s Ongoing Infrastructure & Construction Projects<sup>5</sup>, the City is planning on extending Broadview Avenue further south towards Lake Shore Boulevard East. The final recommended plans for these improvements have not yet been confirmed. Additionally, any improvements are not anticipated to significantly affect the intersection laning and/or operations at the study area intersections, and therefore no changes were made to the future model based on this project.

## 3.2 Background Traffic Volumes

Background traffic volumes are comprised of existing traffic volumes plus general background traffic growth, plus traffic associated with nearby developments, and each component is summarized below.

### 3.2.1 Background Developments

As part of the analysis, nearby background developments were reviewed and accounted for as available in the traffic forecasting process. As shown in **Figure 7**, there are two development applications spanning across 26 properties within a 250 metre radius, both of them are active and under review. See the Planning and Urban Design Rationale submitted with this proposal for more information on the nearby development activity. No documentation was available for the closed project, and the projects under review / being appealed have not yet been approved.

**Figure 7: Adjacent Background Developments for Consideration**

<sup>5</sup> <https://www.toronto.ca/community-people/get-involved/public-consultations/infrastructure-projects/>

### 3.2.2 General Background Growth

A review of the historical traffic counts from various sources, including previous transportation studies, revealed that the magnitude of traffic volumes within the study area has been relatively stable, despite variations in traffic patterns. There are also some movements that have experienced negative growth. A vehicular growth rate of 0.50% was applied to all through movements. This approach was used to assess the worst-case growth conditions of all movements in the study area and is considered a conservative assumption. No growth rate was applied for pedestrians or bicycles. **Figure 8** shows the total future 2032 background traffic volumes, which include background growth, and the adjacent development traffic volumes.

### 3.2.3 East Harbour Transit Hub

The East Harbour Transit Hub has been included as a layer of background growth, and walking and transit trips to/from the station were generated. The generated walking and transit trips were for the 2080 horizon, and are therefore conservative. These trips were distributed and assigned to the study area network, and details can be found in **Figure 8**.

Legend			
xx	A.M. Peak Hour Traffic Volumes	(xx)	P.M. Peak Hour Traffic Volumes
xx	A.M. Peak Hour Pedestrian Volumes	(xx)	P.M. Peak Hour Pedestrian Volumes
xx	A.M. Peak Hour Conflicting Bike Volumes	(xx)	P.M. Peak Hour Conflicting Bike Volumes

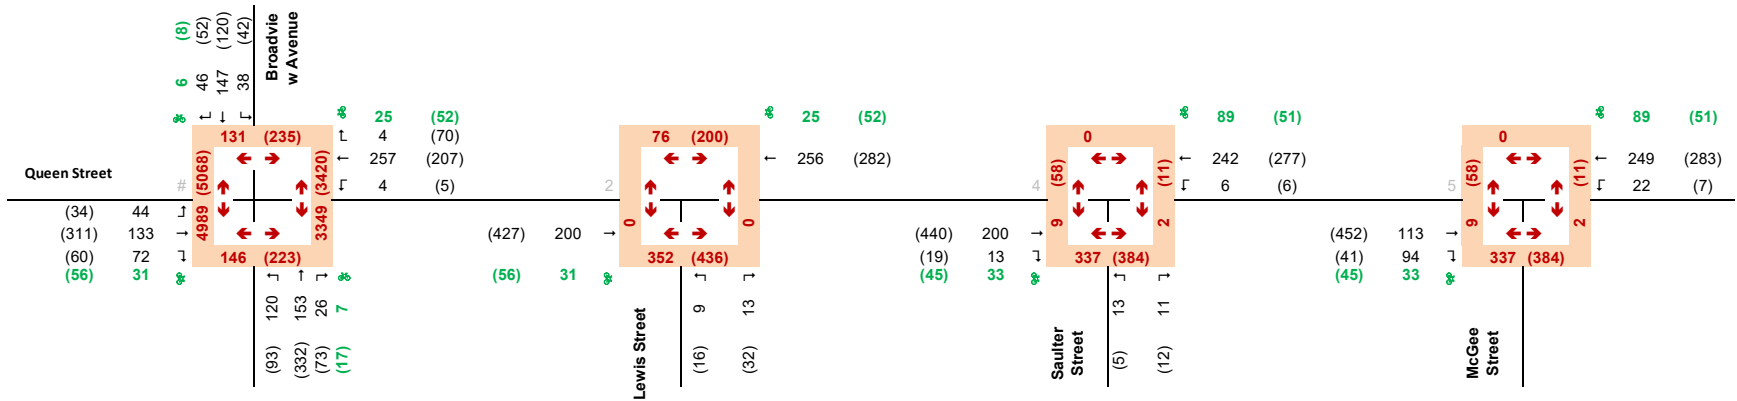

Figure 8: Future 2032 Background Traffic Volumes

### 3.3 Background Traffic Operations

**Table 5** summarizes the LOS and v/c ratio for movements under future background conditions based on the forecast traffic volumes. Signal timing split optimization was incorporated, if needed, into both the AM and PM Synchro models. Detailed Synchro results and reports for all study area intersections are provided in **Appendix B**. Under future background conditions, most movements will operate with LOS ‘D’ or better, except for the northbound movement at Queen Street and Lewis Street. This movement is expected to operate at LOS ‘E’.

**Table 5: 2032 Background Conditions – Summary**

Intersection and Movement		Lanes	Storage (m)	AM Peak Hour			PM Peak Hour		
				LOS	v/c	95 <sup>th</sup> Q	LOS	v/c	95 <sup>th</sup> Q
<b>Queen &amp; Broadview</b>		-	-	<b>B</b>	-	-	<b>B</b>	-	-
Eastbound	Left-Through-Right	2	80	A	0.16	13	A	0.27	28
Westbound	Left-Through-Right	2	92	A	0.16	17	C	0.20	17
Northbound	Left-Through-Right	2	225	C	0.77	26	D	0.94	52

<b>Queen &amp; Saulter</b>		-	-	-	-	-	-	-	-
Westbound	Left	1	71	A	0.02	0	A	0.01	0

Note: LOS = level of service; v/c = volume to capacity ratio; 95<sup>th</sup> Q = 95<sup>th</sup> Percentile Queue using HCM 2000, and Pedestrian Crosswalk LOS using HCM 2010. Critical movements are highlighted in **red** as defined by the City’s TIS Guidelines. Movements with LOS F are highlighted in **yellow**.

## 4 Proposed TOC Trip Generation

### 4.1 Conceptual Site Plan

**Figure 9** shows the conceptual site plans, and **Table 6** shows the site statistics for the site, which were received on August 23<sup>rd</sup>, 2022.

**Table 6: Site Plan Statistics**

Proposal	Residential Units	Commercial Size
<b>Total</b>	<b>142 units</b>	<b>917 m<sup>2</sup> GFA</b>

Residential vehicle access to underground parking is provided on Saulter Street, while truck access for loading/unloading will utilize the existing site driveway on Lewis Street.

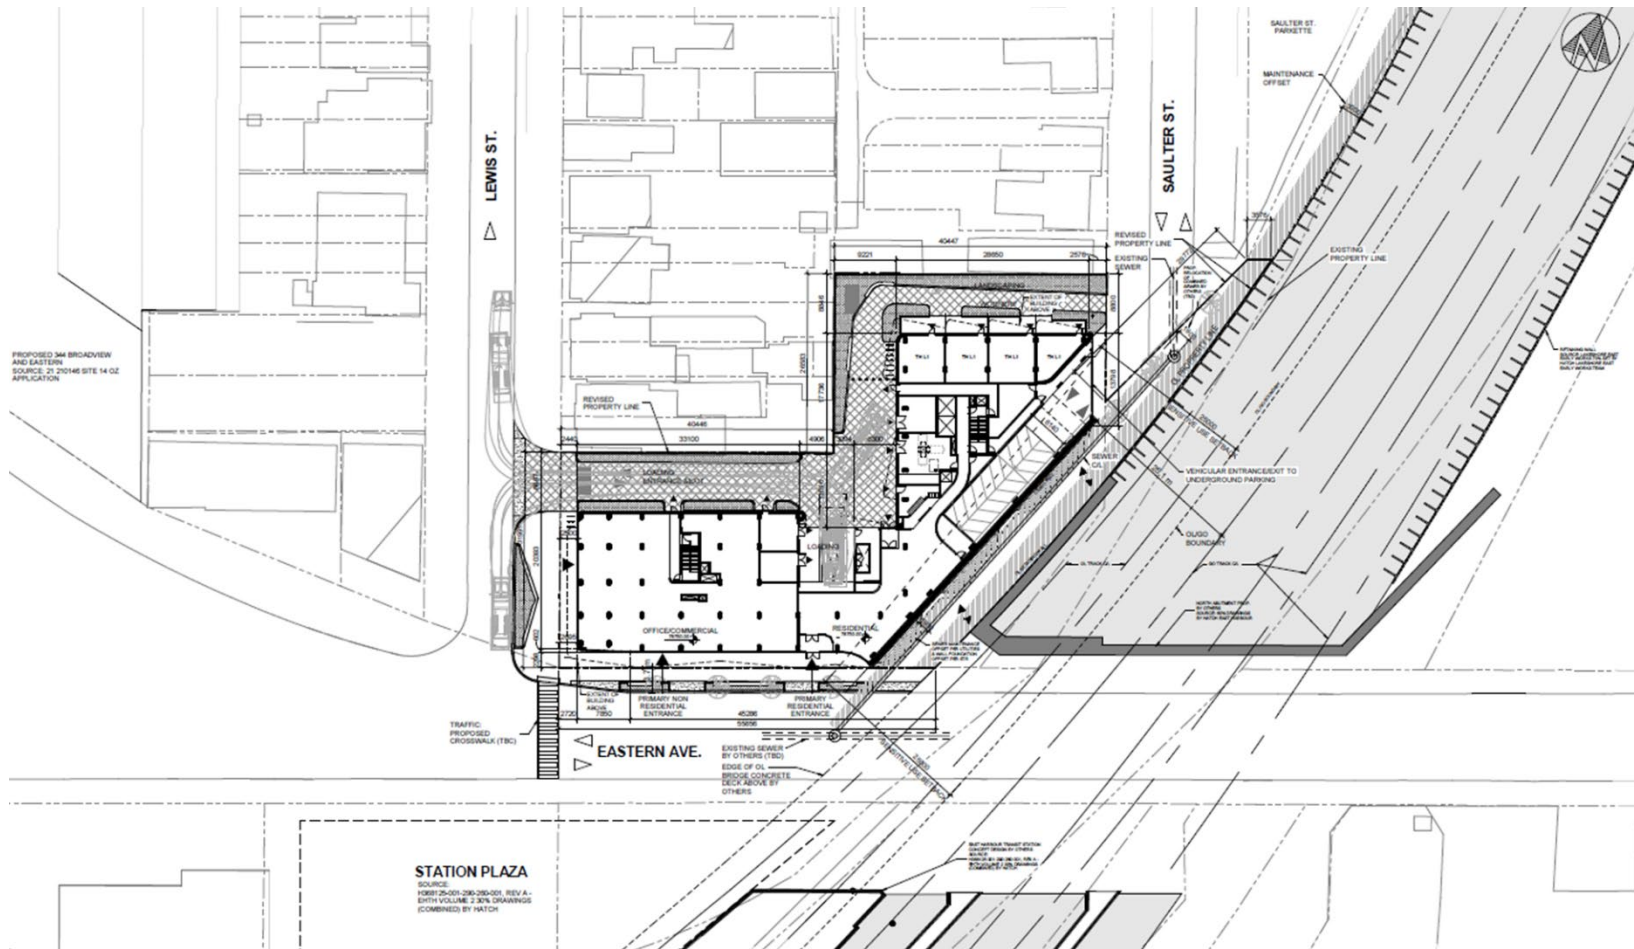

Figure 9: Draft Site Plan (November 9, 2022)

## 4.2 Site Trip Generation

### 4.2.1 Mode Splits

The 2016 Transportation Tomorrow Survey (TTS) was used to inform the future mode split assumptions for the proposed development using existing information. The TTS is a survey of households within the Greater Golden Horseshoe, including the Greater Toronto Area, that summarizes travel patterns and other related transportation information that can be used to aid in planning, such as mode splits. The 2016 TTS divides geographical areas into ‘zones’ for the purposes of determining trip patterns from one zone to another.

The existing mode splits for the area were obtained through a review of TTS (2006) Zones 5, 268, and 271, which are the zones including and surrounding the subject site. The TTS data and the proposed mode splits are summarized in **Table 7**.

The proposed mode splits for AM and PM trips were taken as averages of the respective AM/PM TTS mode splits. The proposed mode splits are considered conservative as they are based on existing mode splits, when in fact, auto trips are anticipated to continue to shift to transit and active transportation as the study area continues to develop and densify, and this change will be further spurred with the addition of the future Ontario Line and East Harbour Station near the subject site.

**Table 7: Mode Splits**

Mode	Existing (TTS)				Proposed	
	AM (In)	AM (Out)	PM (In)	PM (Out)	AM	PM
<b>Transit</b>	20%	31%	45%	31%	25%	38%
<b>Walking</b>	24%	16%	9%	17%	20%	13%
<b>Cycling</b>	10%	10%	5%	9%	10%	7%
<b>Auto Passenger</b>	6%	8%	12%	12%	8%	12%
<b>Auto Driver / Taxi</b>	40%	35%	29%	31%	37%	30%
<b>Total</b>	100%	100%	100%	100%	100%	100%

### 4.2.2 Trip Generation

Trips were generated for the proposed development using the information provided in the Institute of Transportation Engineers (ITE) Trip Generation Informational Report (11<sup>th</sup> edition). Trip generation rates for Land Use 222 (Multifamily Housing – High-Rise), Land Use 215 (Single-Family Attached Housing), and Land Use 820 (Shopping Centre).

The land use assumes dense multi-use conditions for Land Use 222, and general urban/suburban conditions were for the other land uses as the dense multi-use category was not available or data was insufficient.

**Table 8** shows the ITE trip generation rates used for each site land use, and it includes person trip rate, where available. Person trips were back-calculated using vehicle trip rates and mode splits for land use codes without person trip rates. The purpose of generating person trips rather than vehicle trips was to be able to assign pedestrian, cycling and transit trips to the study network.

**Table 9** shows the resulting trip generation for the subject site by mode. Due to the density of compatible land uses in close proximity, an assumed 5% internal capture rate was applied to all trip types, and this is also considered a conservative assumption. Trips generated by Land Use 215 were combined with Land Use 222 due to negligible trips generated (<2 inbound and outbound trips).

**Table 8: ITE Trip Generation Rates**

Land Use	ITE LUC	Peak Hour	ITE Persons Trip Rate	Equation*	Entering	Exiting
Residential	222 Multi-family High Rise	AM	0.21	$\ln(T) = 0.84 \ln(X) - 0.65$	12%	88%
		PM	0.19	$\ln(T) = 0.81 \ln(X) - 0.60$	70%	30%
	215 Single-Family Attached	AM	0.52	$T = 0.51(X) + 1.22$	75%	25%
		PM	0.57	$T = 0.60(X) - 3.93$	57%	43%
Land Use	ITE LUC	Peak Hour	ITE Vehicle Trip Rate	Equation*	Entering	Exiting
Retail	820 Shopping Centre	AM	0.94	$T = 0.50(X) + 151.78$	62%	38%
		PM	3.81	$\ln(T) = 0.74 \ln(X) + 2.89$	48%	52%

Note: The trip generation equation was only used for Residential Land Use, for all other land uses, the total person trips were calculated by multiplying the ITE vehicle trip rate by the person trips per vehicle value to get total person trips.

**Table 9: Trip Generation by Mode**

Land Use	AM Peak Hour			PM Peak Hour		
	Total	In	Out	Total	In	Out
<b>Residential – LUC 222 Multifamily High Rise + LUC 215 Single-Family Attached</b>						
<b>Total</b>	<b>94</b>	<b>23</b>	<b>70</b>	<b>74</b>	<b>42</b>	<b>32</b>

Auto Passenger	8	3	6	14	7	7
Auto Driver	42	13	29	49	26	23

### 4.2.3 Existing Vehicle Site Trips

As there is an existing storage facility on the study sites, site visits were conducted to determine existing vehicle trips generated. The AM peak hour site visit occurred on Tuesday, August 16th, 2022, during 7:45 AM – 8:45 AM, and the PM peak hour site visit occurred on Friday, August 19th, 2022, from 5:00 PM – 6:00 PM. During the site visits, only one vehicle traveled in/out of the existing storage facility.

## 4.3 Site Traffic Distribution and Assignment

Future trip distribution was estimated using the information from the 2016 TTS. The trip distribution for the site was based on the existing distribution to TTS zones (TTS 2006 Zones 5, 268, and 271). Trips were distributed based on each mode of transportation with the assumption that transit trips are made by walking. This is because the trip maker is expected to walk towards the nearest bus/streetcar route. Google directions were also used to understand the fastest routes by time of day, which was used to inform trip assignments. Trip distributions for site trips are summarized in **Table 10**.

A separate trip distribution for walk trips (to/from the station) was conducted for the station. Metrolinx's Greater Golden Horseshoe Model (GGHM) EMME model for Ontario Line provided estimates for walking trips inbound and outbound of EHTH, as well as surface transfers between busses and streetcars. Surface transfers between GO Transit and Ontario Line were also provided. However, they were not assigned to the study intersections because these trips will be contained within the station. A separate trip distribution was conducted for the station, with different distributions used for the walk trips (to/from the station) and the transit trips to/from the station (applied as walk trips but destined to/from the nearby surface transit stops). The distribution for these trips is shown in **Table 11**. They are based on the location of density near the site (related to the walking trips to/from the station) and based on the location of the nearest transit stops (with most located at the intersection of Queen Street and Broadview Avenue. Trips between EHTH and transit trips are distributed 100% to the north because the closest transit streetcars and busses are located at Queens Street and Broadview Avenue (directly north of the station).

**Table 10: Assumed Trip Distribution – Subject Site**

Mode	Time Period / Direction	Direction				
		North	East	South	West	Total
Walk	AM (In)	65%	0%	0%	35%	100%
	AM (Out)	38%	2%	3%	57%	100%
	PM (In)	32%	5%	3%	60%	100%
	PM (Out)	40%	22%	0%	38%	100%
Cycle	AM (In)	21%	23%	0%	56%	100%
	AM (Out)	18%	6%	2%	74%	100%
	PM (In)	21%	0%	2%	76%	100%
	PM (Out)	29%	10%	0%	62%	100%
Transit (Walk)	AM (In)	13%	30%	0%	57%	100%
	AM (Out)	7%	16%	0%	77%	100%
	PM (In)	7%	20%	0%	73%	100%

## 5 Future Total Traffic Conditions with TOC

**Table 12** summarizes the future total traffic operations at the study area intersections. Traffic operations at the proposed Lewis Street and Saulter Street are not presented because they are expected to operate excellently based on existing conditions. The Lewis Street access currently operates without issues and will continue to do so since only trucks will be using this access. The Saulter Street access is at the very end of the road; thus, there will not be conflicting vehicles affecting the inbound and outbound movements at this access. There were no assumed geometric improvements. Detailed results and reports for all study area intersections are provided in **Appendix B**.

Under future total conditions, all movements will still be operating with LOS 'E' or better, and with residual capacity. The addition of pedestrians on Queen Street is expected to increase v/c ratios for the northbound movements at Lewis Street and Saulter Street. That notwithstanding, these movements are still well under capacity.

Optimizing signal phases at Queen Street and Broadview Avenue improves v/c for the northbound approach without significantly degrading the east/west movement performance. However, existing signal timing plans provide sufficient traffic operations at Queen Street and Broadview Avenue under total future conditions.

**Table 12: Future 2030 Total Conditions – Summary**

Intersection and Movement		Lanes	Storage (m)	AM Peak Hour			PM Peak Hour		
				LOS	v/c	95 <sup>th</sup> Q	LOS	v/c	95 <sup>th</sup> Q
<b>Queen &amp; Broadview</b>		-	-	<b>C</b>	-	-	<b>C</b>	-	-
Eastbound	Left-Through-Right	2	80	A	0.16	13	A	0.28	29
Westbound	Left-Through-Right	2	92	A	0.18	18	A	0.22	18
Northbound	Left-Through-Right	2	225	C	0.78	26	D	0.95	52
Southbound	Left-Through-Right	2	64	C	0.55	31	C	0.60	31
<b>Queen &amp; Lewis</b>		-	-	-	-	-	-	-	-
Northbound	Left-Right	1	280	C	0.08	2	<b>E</b>	0.35	12
<b>Queen &amp; Saulter</b>		-	-	-	-	-	-	-	-
Westbound	Left	1	75	A	0.01	0	A	0.03	1
Northbound	Left-Right	1	235	C	0.23	7	<b>E</b>	0.34	11
<b>Queen &amp; Saulter</b>		-	-	-	-	-	-	-	-
Westbound	Left	1	71	A	0.02	1	A	0.01	0

Note: LOS = level of service; v/c = volume to capacity ratio; 95<sup>th</sup> Q = 95<sup>th</sup> Percentile Queue using HCM 2000, and Pedestrian Crosswalk LOS using HCM 2010. Critical movements are highlighted in **red** as defined by the City's TIS Guidelines. Movements with LOS F are highlighted in **yellow**.

## 6 Parking and Loading Assessment

The proposed parking supply was originally reviewed based on the parking requirements of the City-wide Zoning By-law 569-2013, as amended (Office Consolidation) Version Date: March 9th, 2022. The by-law includes specific requirements for parking (bicycle and vehicle) as well as loading. However, the City enacted and passed Zoning By-law 89-2022 on February 3, 2022, which officially shifts the City's approach to one of a maximum limit on supplied parking at new developments instead of a minimum supply requirement. We understand By-law 89-2022 was appealed during the 20-day appeal period mandated by the provincial Planning Act. However, By-law 89-2022 is now in force as of October 12, 2022. Our assessment has review of both by-laws but only the applicable by-law has been documented below.

### 6.1 Policy Area Designations and Parking Requirements

The current city-wide Zoning By-law 89-2022, an amendment to By-law 569-2013 includes multiple sets of vehicle parking rates with diminishing requirements for some areas that have better transit accessibility. Under By-law 89-2022, the 356 Eastern Avenue TOC site falls under Zone "L" as shown in **Figure 12**.

According to By-law No. 569-2013, within Bicycle Zone 1, if bicycle parking is provided in excess of the required minimums, then the minimum vehicle parking requirements can be reduced by 1 vehicle space for every 5 bicycle parking spaces provided beyond the minimum, to a maximum of 20% of the required minimum vehicle parking. The subject site is located in Bicycle Zone 1, which is defined as the area of the City bounded by the Humber River on the west, Lawrence Ave. on the north, Victoria Park Ave. on the east and Lake Ontario on the south.

Toronto Green Standard Version 4 states that "all residential parking spaces provided for dwelling units located in an apartment building, mixed use building, multiple dwelling unit building, excluding visitor parking spaces, must include an energized outlet capable of providing Level 2 charging or higher to the parking space;"<sup>6</sup>.

---

<sup>6</sup> <https://www.toronto.ca/city-government/planning-development/official-plan-guidelines/toronto-green-standard/toronto-green-standard-version-4/mid-to-high-rise-residential-non-residential-version-4/air-quality/>

Figure 12: City of Toronto By-law 89-2022 Parking Zone Areas

## 6.2 Vehicular Parking Supply

The total proposed vehicular parking supply for the site is 35 spaces. The parking is comprised of resident tenant parking and visitor parking, commercial parking. A single level below-grade parking garage will serve residents, visitors, and commercial patrons, and will be accessible from Saulter Street. Surface parking is not provided by the TOC development. However, on-street parking is available on Saulter Street and Lewis Street outside of the TOC development.

The parking supply for the site is summarized in **Table 13**.

Table 13: Vehicle Parking Supply

Residential	Residential Visitor	Non-residential	Car share	TOTAL
25	8	0	2	35

Of the 35 proposed parking spaces, two are designated as accessible parking. In addition, the development proposes 2 car-share spaces, 8 residential visitor spaces, and 25 residential parking. As a result, the blended visitor and residential parking rates are 0.06 and 0.18 per dwelling units, respectively.

As per requirements of Toronto Green Standard Version 4, all residential parking spaces are outfitted with energized outlets capable of providing Level 2 charging for electric vehicles.

### 6.3 Vehicle Parking Requirements (By-law 89-2022)

Vehicle parking requirements were reviewed using By-law 89-2022, and the requirements are as shown in **Table 14**.

**Table 14: Vehicle Parking Zoning By-law 89-2022 Requirements**

Type	Units	By-law 89-2022 [Parking Zone B]		
		Maximum Rate	Minimum # Spaces	Maximum # Spaces
Bachelor (<45 sqm)	-	0.7 spaces per unit	n/a	0
1-bed	100 units	0.8 spaces per unit		80
2-bed	21 units	0.9 spaces per unit		19
3-bed	21 units	1.1 spaces per unit		23
Maximum Resident				122
Visitor Minimum	142 units	2.0 + 0.05/unit	9	-
Visitor Maximum		1.0/unit (first 5 units) + 0.1/unit (6 <sup>th</sup> unit onwards)	-	19
Proposed Visitor Parking			8 (not between 9 and 19 ✖)	
Proposed Resident Parking			25 (less than 178 ✔)	
Non-residential	917 SM	4.0 spaces / 100 SM GFA (Maximum)	37 spaces maximum	

As per By-law 89-2022, the maximum number of parking spaces allowed for the subject site is 141 space, and the minimum number of visitor parking spaces required is 9. The subject site is proposed to provide total 35 parking spaces, thus satisfying By-law 89-2022 parking requirements. However, the visitor parking supply will be deficient by 1 spaces. While the site does not meet parking supply requirements based on By-law 89-2013, on May 24, 2022 in the Final Pre-Submission Meeting with City of Toronto, the City recommended that the site could provide zero parking. No minimum requirements for vehicular parking was imposed onto the developer. However, to support the overall development and avoid illegal on-street parking, one level of parking below grade (with 35 parking spots) was recommended, which was received favourably by the City during this meeting.

**Table 15** below shows the comparison of proposed parking supply to parking requirements under Zoning By-law 89-2022.

**Table 15: Parking Requirements Summary**

Site	Minimum # of Spaces	Maximum # of Spaces	Proposed Spaces	Supplied Parking Rate
Residential	0	122	25	0.18
Visitor	9	19	8	0.06

<b>Non-residential</b>	0	37	0	0.00
------------------------	---	----	---	------

Accessible parking requirements were reviewed based on the new by-laws. **Table 16** show the calculation of effective parking and required accessible parking for 356 Eastern Avenue. The proposed development requires 7 accessible parking spaces whereas, only 2 spaces are provided, which is appropriate with the one underground parking level.

**Table 16: Effective Parking Rates for Accessible Parking**

Type	Units	By-law No. 89-2022	
		Effective Rate	Effective Spaces
Bachelor (<45 sqm)	0 units	0.7 spaces per unit	0
1-bed	100 units	0.8 spaces per unit	80
2-bed	21 units	0.9 spaces per unit	19
3-bed	21 units	1.1 spaces per unit	23
Visitor	-	0.1 spaces per unit	14
Non-residential	917 SM	2.0 spaces / 100 SM GFA	18
Total Effective			154
Total Parking Provided			35
Greater of the Above (Actual Effective)			154
<b>Required Accessible Parking</b> (if the number of effective parking spaces is more than 100, a minimum of 5 accessible parking spaces plus 1 accessible parking space for every 50 effective parking spaces or part thereof in excess of 100 parking spaces)			7 accessible parking spaces required
Accessible Parking Provided			2 spaces
Surplus/Deficit			-5 spaces

## 6.4 Bicycle Parking Supply

Bicycle parking for the site will be provided in the form of short-term and long-term bicycle parking spaces. Short-term bicycle parking will be provided at-grade as well as underground, and will serve residential visitors, commercial patrons, and potentially residents who are making short stops at home. Long-term bicycle parking will be located on the underground parking level. The bicycle parking supply is summarized in **Table 17**.

**Table 17: Bicycle Parking Supply**

	Bicycle Parking Space Type					Total
	Residence Long Term	Residential Short Term	Non-residential Long Term	Non-residential Short Term	Transit	
<b>Total</b>	132	16	8	6	0	<b>162</b>

As per requirements of Toronto Green Standard Version 4, at least a 15% long-term bicycle parking spaces of long-term bicycle parking spaces will be adjacent to an Energized Outlet (120 V). Thus, meeting the requirement that 15% long-term bicycle parking spaces shall include an Energized Outlet (120 V).

## 6.5 Bicycle Parking Requirements

Bicycle parking requirements were reviewed for By-law 569-2013 and summarized in **Table 18**. The proposed bicycle parking supply provides what is required in the By-Law 569-2013 and will have a surplus of 18 spaces. Overall, the proposed bicycle parking supply is anticipated to serve the development well.

**Table 18: Bicycle Parking Zoning By-law Requirements – North Site**

Land Use		Unit or per 100 sqm	By-law No. 569-2013			
			Long Term		Short Term	
			Rate	# required	Rate	# required
<b>356 Eastern Avenue</b>	Residential	143	0.9	128	0.1	15
	Non-residential	560	0.2	2	0.3 + 0.3 / 100 sqm	6
<b>Total Required</b>			-	130	-	21
<b>Proposed</b>			-	140	-	22
<b>Surplus / Deficit</b>			-	10	-	1

## 6.6 Loading Space Requirements

Loading space requirements of Zoning By-law 569-2013 were also reviewed for the proposed site. The loading space requirements as per the By-law, and loading spaces provided, are shown in **Table 19**.

**Table 19: Loading Spaces Required Based on By-Law Rates**

Land Use Type	Unit or sqm	Loading space required	Loading space provided
Residential	142	1 Type "G"	1 Type "G"
Non-residential	917	1 Type "B"	1 Type "B"
<b>Total (Shared)</b>	-	<b>1 Type "B" and 1 Type "G"</b>	<b>1 Type "B" and 1 Type "G"</b>

The dimensions of the proposed loadings spaces meet the By-law requirements, with the dimensions of each type listed below.

### Type "G"

- Minimum Length: 13.0 metres
- Minimum Width: 4.0 metres
- Minimum Clearance: 6.1 metres

### Type "B"

- Minimum Length: 11.0 metres

- Minimum Width: 3.5 metres
- Minimum Clearance: 4.0 metres

### 6.6.1 Loading Swept Path Analysis

The loading areas were tested using AutoTURN software (within AutoCAD) to check the loading space accessibility for the anticipated design vehicles entering the site, and for each of the building loading areas. A Medium Single-Unit Truck ('MSU') style delivery or moving vehicle and a front end load garbage / recycling truck (FEL) were tested. The design vehicles are shown in **Figure 13**.

**Figure 14** and **Figure 15** shows inbound and outbound swept path analysis of each design vehicle. All loading spaces are accessible with the design vehicles.

**Figure 13: Design Vehicles**

Figure 14: FEL Swept Path Analyses

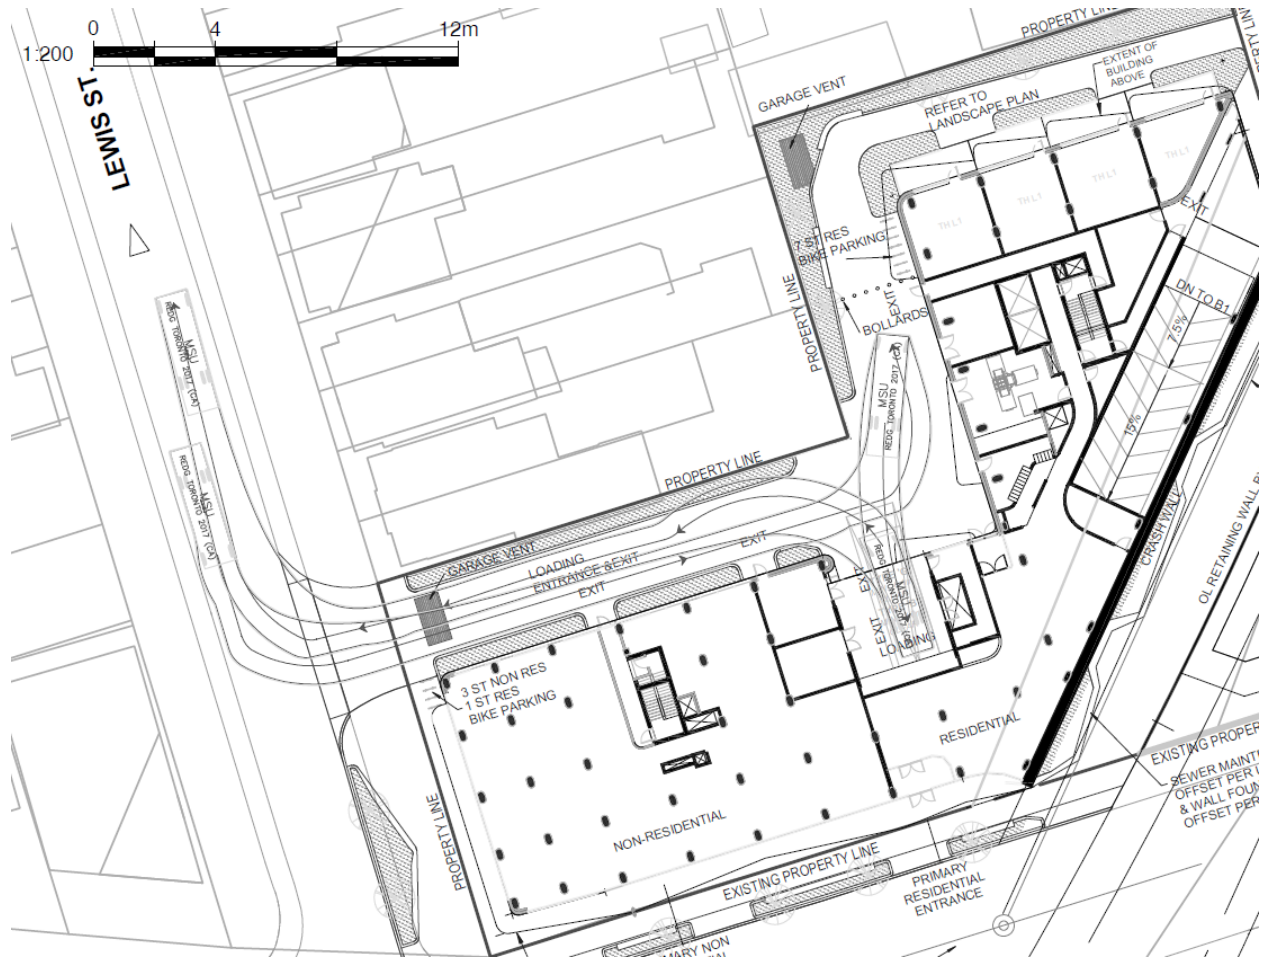

Figure 15: MSU Swept Path Analyses

## 7 Transportation Demand Management ('TDM')

Transportation Demand Management (TDM) measures are methods employed to reduce the traffic impacts of a development through the reduction of Single-Occupant Vehicle (SOV) trips as well as the encouragement of more sustainable forms of travel and more efficient use of the transportation network for all modes of travel. TDM measures can be 'hard measures', such as infrastructure like bicycle parking, or can be 'soft measures' such as policies that allow for working-from-home or flex hours. TDM measures must also be tied to the surrounding transportation network context of the development. For example, bicycle parking will be ineffective if there is no surrounding bicycle infrastructure like bicycle lanes, multi-use paths, or a lack of bicycle parking at the ultimate destination. For this reason, successful TDM implementation requires a united effort and coordination between the City and developers.

Hard measures are physical infrastructure improvements that encourage alternative modes of travel and mode shifts away from single-occupant vehicles. This can include the provision of bicycle parking or enhanced pedestrian and cyclist facilities on-site including shower and change facilities for employment uses. Soft measures are programs or policies, such as unbundling or condo units to parking spaces, work-from-home policies, transit subsidies, carpooling assistance etc. In many cases, hard and soft measures work together and provide mutual benefit. For instance, transit pass subsidies are soft measures, but when paired with hard measures like improved waiting areas, can have a greater impact on mode choice.

The Toronto Green Standard (Version 4) requires measures that will support a 25% or greater reduction in single occupancy vehicle (SOV) trips.

For the subject site, the general context of the area as a downtown city centre-core, mixed-use environment with excellent transit access and future direct transit access to the Ontario Line, will have an impact on the potential TDM measures. In fact, the inherent nature of the area and the presence of the Ontario Line and streetcar surface transit routes along both roadways adjacent to the development will make this location an excellent candidate to benefit from TDM initiatives.

The mixed use nature of surrounding areas allows for synergy and mixed-use interactions between the proposed mid-rise building, and non-residential uses at the ground floor, and the surrounding retail-commercial and services that are in the area. Additionally, due to the location near the East Harbour Transit Hub, there is an expectation that many of the residents will work within the general area and will not rely on transit to make their daily trips. Rather, these residents will walk or cycle. The mixed-use, and walkable nature of the area will in itself help to reduce vehicle trips by encouraging walking and linked trips.

Regardless of the ability for the development to leverage TDM initiatives, the strongest TDM measure will be the fact that mid-rise building will be able to provide limited vehicular parking. A significant amount of trips generated by the development will be pick-up/drop-off or taxi/rideshare trips. The occupancy of the buildings will be market-driven, meaning that a lot of residents who decide to purchase units in this building will want to be car-free and many will live and work in close proximity, thus relying on transit, walking, and cycling to get around.

Since the ancillary commercial will primarily serve the surrounding area and the residential condos above, the TDM plan will be geared towards adapting the residential component.

## 7.1 TDM Measures

### 7.1.1 Local and Regional Transit Accessibility

As already discussed, there is excellent transit coverage within the vicinity of the site even without the construction of Ontario Line. TTC surface transit is provided in the form of streetcars along Queen Street and Broadview Avenue (in mixed traffic). Additionally, the streetcar route provides direct access to the Toronto subway system along Line 1 (westerly to Queen Station). Bus transit stops are located directly at the intersection of Queen Street and Broadview Avenue, 400 metres from the site.

With Ontario Line, subway access will be directly accessible by residents within a 250 metre walking distance. Ontario Line riders will be able to transfer at Queen Station (Queen Street and Yonge Street).

The study area already has a high non-vehicle modal split of around 70% non-auto, and this is expected to increase in general due to the increase in transit availability. The site itself will further benefit and leverage this proximity and access.

### 7.1.2 Pedestrian and Cycling Connections

The site will be directly fronting Eastern Avenue, and Lewis Street for direct access to the cycling network. The surrounding area is well-served for pedestrians with well-connected sidewalk networks. Residents and costumers at 356 Eastern Avenue will not have issues walking to transit and/or retailers around the area.

Bicycles are also allowed on the GO Rail and Ontario Line system outside of peak periods. Residents will be able to bring their bicycles on the subway and use them to complete the last leg of their trips, if it is conducive to their needs.

### 7.1.3 Bicycle Parking

The building will be equipped with long-term bicycle parking that will be available to all residents. Long-term bicycle parking ensures that residents are encouraged to own bicycles in the first place by providing them with easily accessible, secure and sheltered bicycle parking. Short-term bicycle parking will be provided for visitors. The short-term bicycle parking will be placed in safe, well lit, accessible areas at ground level. This will encourage visitors to feel cycling is a viable option.

Toronto Bike Share is also available within the general area. There are two bikeshare stations within 400 metres walking distance. These will also be available for use by residents and visitors if they use the bikeshare services. Bikeshare spaces are considered usable if they are occupied or empty, as they can be used by residents or visitors when leaving the site (bicycle is available) or when returning (there is a free “dock”).

One bicycle repair station is recommended to be installed on site. Bicycle repair stations further encourage residents and visitors to travel by bicycle by providing tools needed to do routine and basic maintenance on bicycles.

#### **7.1.4 Car-Share Services**

Car-share services are an effective way to reduce auto dependency and parking needs for both residential and non-residential developments, by providing vehicles that can be used by residents on an as-needed basis. The result is that the development will attract those who do not own vehicles and typically rely on alternative forms of transportation, thus reducing the number of parking spaces required on site and attracting residents that will generally produce fewer vehicle trips, but will still occasionally require a vehicle.

The proposed two car share spaces are more than sufficient to accommodate potential demands for the proposed size of development.

#### **7.1.5 Unbundled Resident Parking**

Bundling parking spaces with unit sales, whether intended or not intended, results in the building being marketed to drivers and vehicles owners. For those who do not own vehicles and do not wish to own a parking space, these hidden costs are forced on them and at the very least result in unwanted effort required to rent out and seek a renter for the parking space in an effort to recuperate lost money.

Therefore, unbundling further benefits the developer as well as the community because the building will automatically be marketed to and attract those who do not drive as a primary form of transportation. This theoretically reduces parking requirements for the building, reduces the amount of congestion on the surrounding road network, and allows for more efficient site design and use of the transportation network. Unbundled parking could lead to a potential 10% to the residential parking rates.<sup>7</sup>

Unbundled resident parking is a given for this proposed TOC site given that there will only be 25 parking spaces for 142 units. Summary of Transportation Demand Management

The following summarizes the measures that will support a 25% or greater reduction in single occupancy vehicle (SOV) trips as required by the Toronto Green Standard (Version 4):

- Proximity to Ontario Line and GO rail service;
- Proximity to other surface transit routes along Queen Street and Broadview Avenue;
- Location in a mixed-use corridor environment to promote walking and cycling trips;
- Unbundled Resident Parking; and
- Carshare services.

---

<sup>7</sup> [https://www.vtppi.org/park\\_man.pdf](https://www.vtppi.org/park_man.pdf)

## 7.2 Toronto Green Standard

The TDM plan presented in **Section 7.1** supports the Tier 1 standard of the updated Toronto Green Standards (Version 4) for mid and high-rise residential buildings requiring that all development proposals have a 25% or greater reduction occupancy vehicle SOV trips.

Conservative estimates of the expected SOV trip reductions for the TDM measures are summarized in **Table 20**.

**Table 20: Estimated Decrease in SOV**

TDM Measure	Estimated % decrease in SOV	Details
Reduced Vehicle Parking Supply in combination with car share services, increased bike parking spaces, and bicycle repair station	≤ 20%	Overprovision of parking is known to encourage and reinforce the use of single occupant vehicles, even when transit is a viable option. Therefore, reduced parking supplies are expected to result in reduced parking demand and vehicle trips under some circumstances such as when there is a mixed-use environment, supporting nearby amenities, good transit services. The subject development meets this criterion.  The proposed parking supply is 80% lower than the require parking supply based on the current in-force zoning By-law 89-2022. There, the vehicle trips are also likely to be reduced.
Pedestrian Connections	≤ 1%	The site is located directly adjacent to Eastern Avenue and Lewis Street and will have direct access to sidewalks.
Supporting Amenities	≤ 5%	The location of the development is approximately 300 metres from mixed-used developments with supporting amenities such as banks and grocery stores will increase interaction trips.
Total:	≤ 26%	Expected to exceed the minimum 25% reduction of SOV Trips

The above measures are expected to meet and likely to exceed the required 25% reduction to single occupant vehicle trips. Additionally, there are other measure that will also contribute to the marketing of this development as transit oriented and will encourage a market interest by those who do not rely on single-occupant vehicles even if those measures may not directly impact mode choice.

Toronto Green Standard Requirement	Proposed Development
<p><b>AQ 1.1 Single-Occupant Vehicle Trips</b>                      Reduce single occupancy auto vehicle trips generated by the proposed development by 25% through a variety of multimodal infrastructure strategies and Transportation Demand Management (TDM) measures</p>	<p>As discussed in <b>Section 7.1</b>, the TDM measures proposed are expected to meet and likely exceed the required 25% reduction to single-occupant vehicle trips.</p>
<p><b>AQ 1.2 Electric Vehicle Infrastructure</b>                      Parking spaces must be equipped with an energized outlet, which is clearly marked and identified for electric vehicle charging, in accordance with Zoning By-law 569-2013, as amended: 2,3,4,5,6,7,8                      1. all residential parking spaces provided for dwelling units located in an apartment building, mixed use building, or multiple dwelling unit building, excluding visitor parking spaces, must include an energized outlet capable of providing Level 2 charging or higher to the parking space; and,                      2. in cases other than those set out in (A) above, 25 percent of the residential and non-residential parking spaces in a building must include an energized outlet capable of providing Level 2 charging or higher.</p>	<p>All resident parking spaces will be electrified.</p>
<p><b>AQ 2.1 Bicycle Parking Rates</b>                      Provide bicycle parking spaces in accordance with Chapter 230 of Zoning By-law 569-2013.</p>	<p>The bicycle parking supply meets the requirements outlined in the City-wide Zoning by-law</p>
<p><b>AQ 2.2 Long-term Bicycle Parking Location</b>                      Long-term bicycle parking must be provided in a secure controlled-access bicycle parking facility or purpose-built bicycle locker on the first or second story of the building or on levels below ground commencing with the first level below ground</p>	<p>Long-term bicycle parking spaces are provided at basement level 1.</p>
<p><b>AQ 2.3 Short-term Bicycle Parking Location</b>                      Locate short-term bicycle parking in a highly visible and publicly accessible location at-grade or on the first parking level of the building below grade</p>	<p>As discussed in <b>Section 6.4</b>, all short-term bicycle parking spaces are located at-grade in publicly accessible locations.</p>
<p><b>AQ 2.4 Electric Bicycle Infrastructure</b>                      Residential: At least 15% of the required long-term bicycle parking spaces, or one parking space, whichever is greater, shall include an Energized Outlet (120 V) adjacent to the bicycle rack or parking space.</p>	<p>Long-term parking spaces for residents will be electrified.</p>
<p><b>AQ 2.5 Shower and Change Facilities</b>                      Provide shower and change facilities consistent with the rate identified in Chapter 230 of the City-wide Zoning By-law.</p>	<p>N/A</p>
<p><b>AQ 2.6 Publicly Accessible Bicycle Parking</b>                      For all uses within 500m of transit station entrance, provide at least 10 additional publicly accessible, short-term bicycle parking spaces, at-grade on the site or within the public boulevard in addition to bicycle parking required under <b>AQ 2.1</b>.</p>	<p>Not applicable to development site since no existing transit station exists within 500 metre of the proposed development. The future East Harbour Transit Hub will be constructed after the proposed development and will provide sufficient publicly accessible bicycle parking on its site.</p>
<p><b>AQ 3.1 Connectivity</b>                      Provide safe, direct, universally accessible pedestrian routes, including crosswalks and midblock crossings that connect the buildings on-site to the off-site pedestrian network and priority destinations.</p>	<p>Main entrances have pedestrian connections directly to the neighbourhood sidewalk network.</p>
<p><b>AQ 3.2 Sidewalk Space</b>                      Provide a context-sensitive pedestrian clearway that is a minimum of 2.1m wide, to safely and comfortably accommodate pedestrian flow.</p>	<p>Pedestrian areas surrounding the building will be designed to meet this criterion.</p>
<p><b>AQ 3.3 Weather Protection</b>                      Provide covered outdoor waiting areas for pedestrian comfort and protection from inclement weather.</p>	<p>Canopies are provided above the main entrances of the building.</p>
<p><b>AQ 3.4 Pedestrian Specific Lighting</b>                      Provide pedestrian scale lighting that is evenly spaced, continuous and directed onto sidewalks, pathways, entrances, outdoor waiting areas and public spaces.</p>	<p>Pedestrian-scale lighting will be provided throughout the site.</p>

## 8 Preliminary Findings and Next Steps

### 8.1 Traffic Forecasts

The study network currently operates within standard performance thresholds. The proposed development will add approximately 50 two-way peak hour vehicle trips (AM/PM) to the street network. The future East Harbour Transit Hub is estimated to add approximately 17,000 pedestrians onto the surround network. A vast majority of these pedestrians are walking directly to/from the station and approximately 1,500 pedestrians are estimated to transfer to surface transit.

### 8.2 Traffic Capacity and Operations

Under existing conditions, the study intersections along Queen Street operate satisfactory and is well under capacity. The addition of pedestrians to/from East Harbour Transit Hub in future background conditions, it is expected to worsen traffic operations at Queen Street and Broadview Avenue. However, the intersection is expected to operate overall satisfactory. All movements at Queen Street and Broadview Avenue are expected to be under capacity. The northbound approach is nearing capacity with  $v/c = 0.94$ . Under total future conditions, the additional site traffic is not expected to significantly worsen traffic operations along Queen Street. All study intersections are anticipated to operate under capacity.

#### 8.2.1 Recommended Mitigation Measures

The closest pedestrian crossing of Eastern Avenue is at Broadview Avenue, which is about 110 meters west of Lewis Street. The anticipated TOC pedestrian volumes generated from the TOC development are very low; around 20 during AM and PM peak periods. This does not warrant a Intersection Pedestrian Signal on Eastern Avenue. The proposed East Harbour Station will have primary access through Broadview Avenue and secondary access through Eastern Avenue. To accommodate and distribute pedestrian movements, and to provide safe and convenient pedestrian crossing destined to East Harbour Transit Hub, we recommend a pedestrian crosswalk at the east leg of Eastern Avenue and Lewis Street intersection. We also recommend a pedestrian crossing warning signs on Eastern Avenue, east and west of Lewis Street. This mitigation is recommended based on the traffic volume generated by the TOC development site and it should be further evaluated by the East Harbour Transit Hub Design team to ensure it is sufficient to accommodate the station pedestrian traffic.

### 8.3 Parking

The maximum parking space allowed for the proposed development is 178 spaces (122 for residents, 19 for visitors, and 37 for non-residential) based on By-law 89-2022. The proposed parking supply is well under By-law 89-2022 requirements. The minimum parking space required for the proposed development is 9 visitor parking based on By-law 89-2022. The proposed number of visitor parking is 8. The minimum parking requirements are not satisfied based on By-law 89-2022. City of Toronto staff has identified no minimum parking requirements at this site for the development. Therefore, the development on 356 Eastern Avenue does not have to adhere parking requirements set out by By-law 89-202.

As per the Toronto Green Standard Version 4 requirements, all residential parking spaces will include an energized outlet capable of providing a minimum of Level 2 charging.

The bicycle parking requirements based on By-law 569-2013 are 162. The bike parking provided is in surplus to the requirement and will serve all anticipated needs.

## **8.4 Loading**

Application of Zoning By-laws 569-2013 and 438-86 requires one Type 'G', and one Type 'C' loading spaces on all sites. Loading sites provided satisfy all the requirements. The proposed development also accommodates the required maneuvering of all truck types, coming in and going out.

# Lanes, Volumes, Timings

## 543: Navy Wharf Ct/Broadview Ave & Queen St

10/21/2022

Actuated Cycle Length: 90

Offset: 30 (33%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.64

Intersection Signal Delay: 19.1

Intersection LOS: B

Intersection Capacity Utilization 82.0%

ICU Level of Service D

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 543: Navy Wharf Ct/Broadview Ave & Queen St

# Lanes, Volumes, Timings

## 543: Navy Wharf Ct/Broadview Ave & Queen St

10/21/2022

Actuated Cycle Length: 90

Offset: 22 (24%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.87

Intersection Signal Delay: 20.4

Intersection LOS: C

Intersection Capacity Utilization 81.5%

ICU Level of Service D

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 543: Navy Wharf Ct/Broadview Ave & Queen St

<b>Intersection Summary</b>		

# Lanes, Volumes, Timings

## 543: Navy Wharf Ct/Broadview Ave & Queen St

10/21/2022

Actuated Cycle Length: 90

Offset: 30 (33%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.77

Intersection Signal Delay: 20.2

Intersection LOS: C

Intersection Capacity Utilization 82.7%

ICU Level of Service E

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 543: Navy Wharf Ct/Broadview Ave & Queen St
